Error. Storages
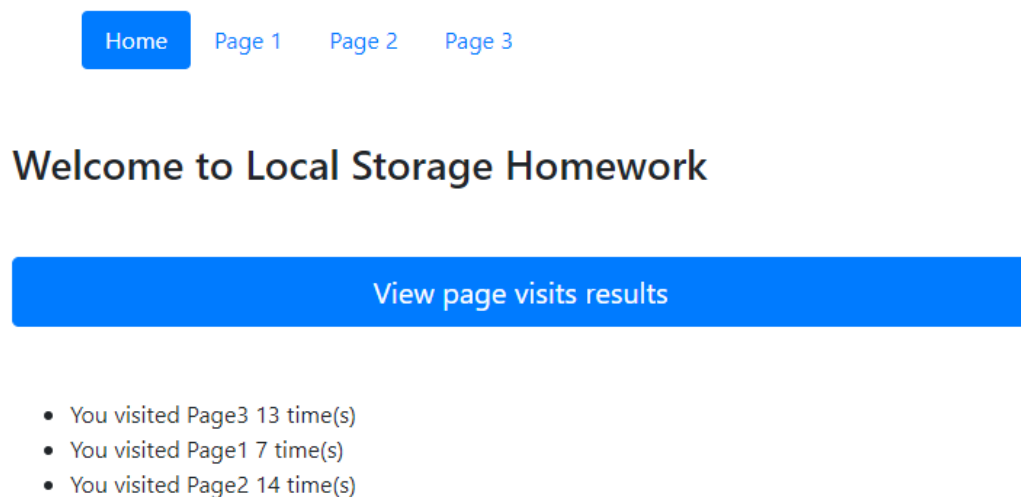

Task 1.

- You need to implement two functions in *index.js* – visitLink and viewResults.
- visitLink function should save to localStorage how many times each link was clicked (visited).
- viewResults should display a list how many times each link was visited (see example below) and afterwards clear the storage

Task 2.

- Implement PIPE function.
- The function is supposed to accept the following arguments: value and a sequence of functions.
- Each of the functions should operate on the provided value and pass the output to the other function in a sequence.
- In case provided argument is not a function, pipe should immediately throw an error and stop the execution.

Example:

```
const result = pipe(
```

```javascript
  "john_doe",
  replaceUnderscoreWithSpace,
  capitalize,
  appendGreeting,
);

alert(result); // Hello, John Doe!

const result = pipe(
  "john_doe",
  replaceUnderscoreWithSpace,
  capitalize,
  "",
);

alert(result); // Provided argument at position 2 is not a function!
```
